## 1 Préparation du jeu de données

### 1.1 Exploration des 7 jeux de données

```
[1]: # (1) Import des packages
import pandas as pd
import numpy as np
import matplotlib.pyplot as plt
import seaborn as sns
import itertools
from statsmodels.formula.api import ols
import statsmodels.api as sm
from statsmodels.graphics.mosaicplot import mosaic
from statsmodels.api import qqplot
from statsmodels.stats.multicomp import pairwise_tukeyhsd
from scipy import stats
from statsmodels.formula.api import logit
from statsmodels.formula.api import glm
from statsmodels.genmod import families

[2]: # (2) Import du jeu de données "countries.HDI.csv"
countries_HDI = pd.read_csv(r"C:\Users\quent\Documents\DU Data Analyst\
→2022\UE n°3 - Introduction aux statistiques\Jeux de données\countries.HDI.
→csv", low_memory = False, encoding = "latin-1")
first_line = list(countries_HDI.columns)
countries_HDI = countries_HDI.rename(columns = {"Norvège": "Country", "TH":
→"Country_HDI", "1": "Country_rank"})
countries_HDI = countries_HDI.append({"Country": first_line[0], "Country_HDI":
→ first_line[1], "Country_rank": first_line[2]}, ignore_index = True)

[3]: # (3) Import des jeux de données sur les questionnaires
effec1_quest_compil = pd.read_csv(r"C:\Users\quent\Documents\DU Data Analyst\
→2022\UE n°3 - Introduction aux statistiques\Jeux de données\effec1.quest.
→compil.csv", low_memory = False, encoding = "latin-1")
effec2_quest_compil = pd.read_csv(r"C:\Users\quent\Documents\DU Data Analyst\
→2022\UE n°3 - Introduction aux statistiques\Jeux de données\effec2.quest.
→compil.csv", low_memory = False, encoding = "latin-1")
effec3_quest_compil = pd.read_csv(r"C:\Users\quent\Documents\DU Data Analyst\
→2022\UE n°3 - Introduction aux statistiques\Jeux de données\effec3.quest.
→compil.csv", low_memory = False, encoding = "latin-1")
```

```

effec3_quest_compil = effec3_quest_compil[effec3_quest_compil["Student_ID"].
↳notnull()] # (sélection des lignes ayant des valeurs non-nulles pour
↳l'identifiant étudiant)

```

```

[4]: # (4) Import des jeux de données de logs
usages_effec1 = pd.read_csv(r"C:\Users\quent\Documents\DU Data Analyst
↳2022\UE n°3 - Introduction aux statistiques\Jeux de données\usages.effec1.
↳csv", low_memory = False, encoding = "latin-1")
usages_effec2 = pd.read_csv(r"C:\Users\quent\Documents\DU Data Analyst
↳2022\UE n°3 - Introduction aux statistiques\Jeux de données\usages.effec2.
↳csv", low_memory = False, encoding = "latin-1")
usages_effec3 = pd.read_csv(r"C:\Users\quent\Documents\DU Data Analyst
↳2022\UE n°3 - Introduction aux statistiques\Jeux de données\usages.effec3.
↳csv", low_memory = False, encoding = "latin-1")

```

## 1.2 Fusion des 7 jeux de données pour obtenir une unique base de données rectangulaire

```

[5]: # (1) Fusion des données de questionnaires et de logs pour chaque itération
iteration1 = pd.merge(effec1_quest_compil, usages_effec1, how = "outer", on =
↳"Student_ID")
iteration2 = pd.merge(effec2_quest_compil, usages_effec2, how = "outer", on =
↳"Student_ID")
iteration3 = pd.merge(effec3_quest_compil, usages_effec3, how = "outer", on =
↳"Student_ID")

```

```

[6]: # (2) Ajout d'une colonne "itération" dans les 3 tableaux créés
iteration1["Iteration"] = [1] * iteration1.shape[0]
iteration2["Iteration"] = [2] * iteration2.shape[0]
iteration3["Iteration"] = [3] * iteration3.shape[0]

```

```

[7]: # (3) Fusion des trois itérations
iteration123 = pd.concat([iteration1, iteration2, iteration3])

```

```

[8]: # (4) Ajout des données sur l'IDH des pays
countries_HDI = countries_HDI[countries_HDI["Country"].notnull()]
countries_HDI = countries_HDI.drop(columns = ["Country_HDI"])
df_final = pd.merge(iteration123, countries_HDI, how = "left", on = "Country")
df_final.info()

```

```

<class 'pandas.core.frame.DataFrame'>
Int64Index: 17411 entries, 0 to 17410
Columns: 121 entries, Student_ID to Country_rank
dtypes: float64(87), int64(1), object(33)
memory usage: 16.2+ MB

```

### 1.3 Simplification du jeu de données final

```
[9]: # (1) Suppression de toutes les variables issues des questionnaires à
      ↳ l'exception de Student_ID, Gender, Country, Country_HDI et Country_HDI.fin
columns_to_remove = list((list(efec1_quest_compil.columns),
      ↳ list(efec2_quest_compil.columns), list(efec3_quest_compil.columns)))
columns_to_remove = list(itertools.chain.from_iterable(columns_to_remove))
columns_to_remove = list(dict.fromkeys(columns_to_remove))
for i in ["Student_ID", "Gender", "Country", "Country_HDI", "Country_HDI.
      ↳ fin"]:
    columns_to_remove.remove(i)
df_final = df_final.drop(columns = columns_to_remove)
```

```
[10]: # (2) Remplacement des caractères "Ã\x89" par "É"
df_final = df_final.replace("Ã\x89", "É", regex = True)
```

### 1.4 Création de trois nouvelles variables et calcul du nombre d'apprenants par catégorie d'HDI

```
[11]: # (1) Calcul du nombre total de vidéos visionnées par apprenant ; les vidéos
      ↳ de présentation (ex : "Prez.sem.1") sont exclues du calcul
my_list = list(df_final.iloc[:, 20:55].columns)
letter_S = "S"
columns_videos = [idx for idx in my_list if idx[0].lower() == letter_S.
      ↳ lower()]
df_final_videos = df_final.loc[:, columns_videos]
df_final["Nb_tot_video"] = df_final_videos.sum(axis = 1, skipna = False)
df_final["Nb_tot_video"].describe()
```

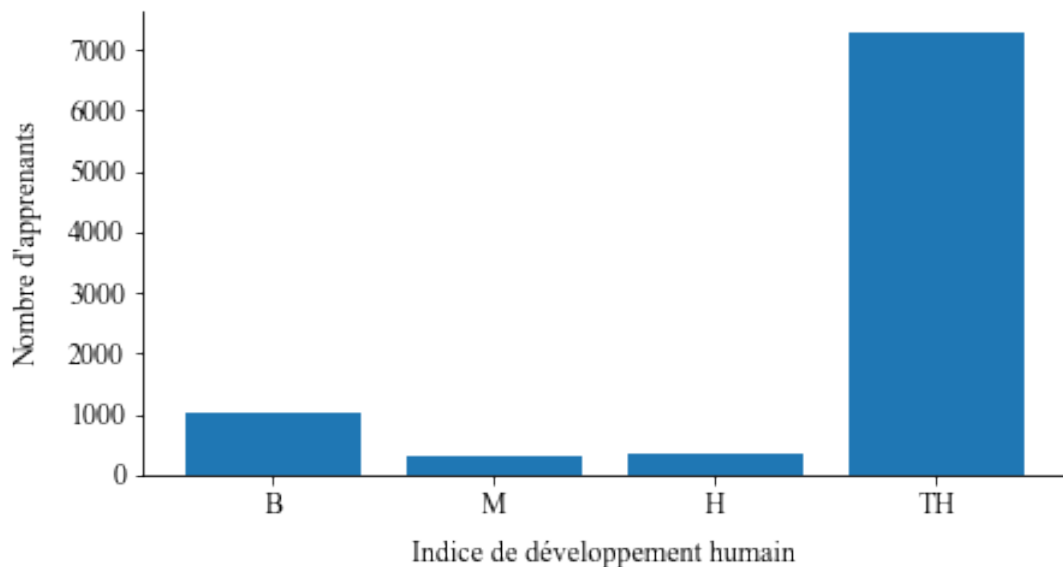

```
[11]: count    15646.000000
      mean       8.909498
      std       11.236576
      min        0.000000
      25%        0.000000
      50%        2.000000
      75%       17.000000
      max       30.000000
      Name: Nb_tot_video, dtype: float64
```

```
[12]: # (2) Calcul du nombre total de quiz réalisés par apprenant
df_final_quiz = df_final.iloc[:, [10, 12, 14, 15 ,17]]
df_final["Nb_tot_quiz"] = df_final_quiz.sum(axis = 1, skipna = False)
df_final["Nb_tot_quiz"].describe()
```

```
[12]: count    15646.000000
      mean       1.932890
      std        2.185275
      min        0.000000
      25%        0.000000
      50%        1.000000
      75%        5.000000
```

```
max          5.000000
Name: Nb_tot_quiz, dtype: float64
```

```
[13]: # (3) Calcul du nombre d'apprenants par catégorie d'IDH et représentation
      ↪ graphique
Nb_cat_HDI = df_final.groupby("Country_HDI").size()
plt.rc("font", family = "Times New Roman", size = 12)
fig, ax = plt.subplots(figsize = (17.5/2.54, 9/2.54))
